

Correct-model log-evidence vs data length n (mean $\pm$ sd over reps)

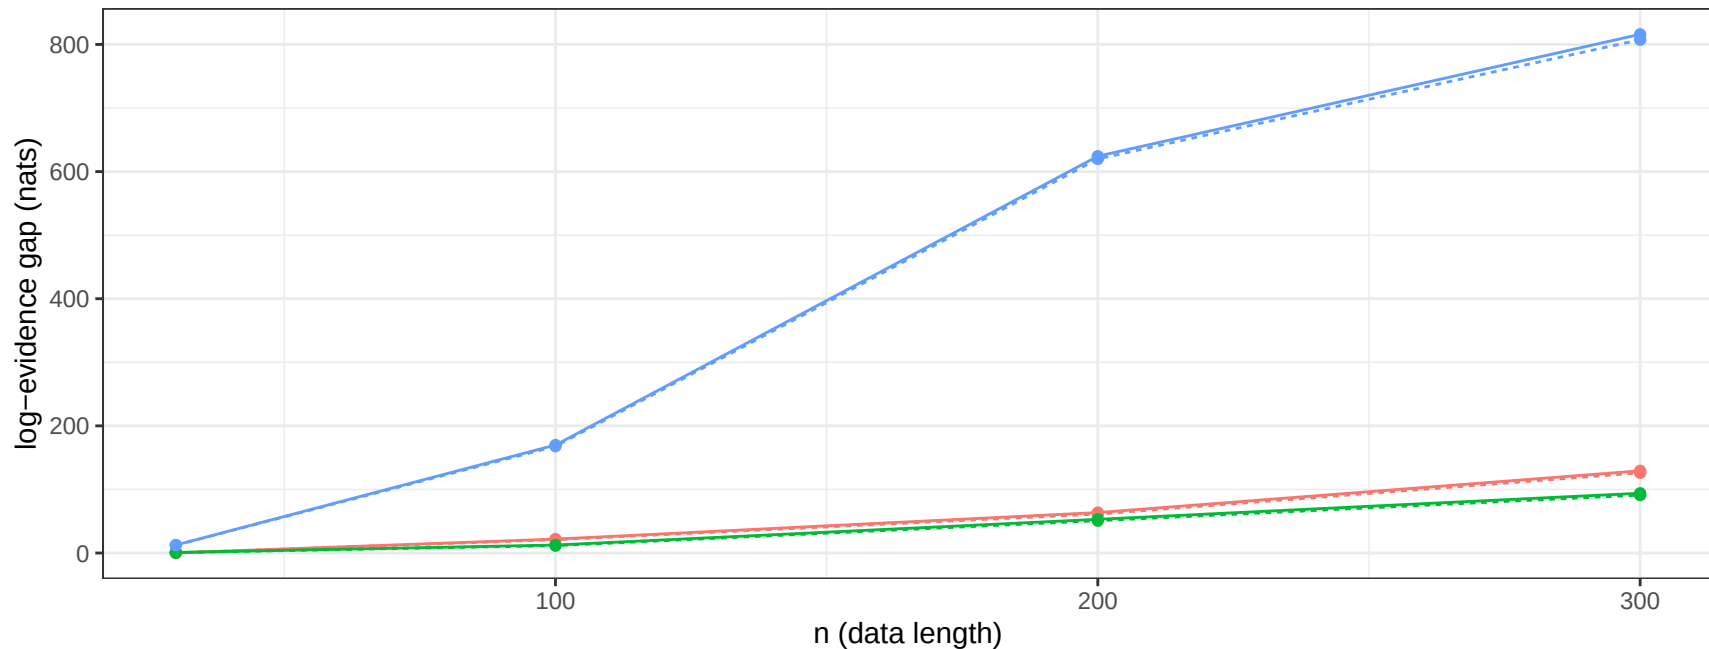

ABC-SMC RE-gaussian RE-pcnmala

ABC-SMC evidence bias vs n (RE minus ABC-SMC log-evidence)

the RE moves are the low-variance reference; the gap $\sim$ ABC-SMC downward bias

RE move — RE-gaussian RE-pcnmala — MA(2) data — MA(3) data — MA(4) data

Cost of MALA-pCN vs the exact Gaussian move (RE-gaussian - RE-pcnmala)

near zero => pcn-mala matches the exact-draw evidence

MA(2) data MA(3) data MA(4) data
